(Randall, Sundrum '99)

# OK, BOOMER

(Technically, I am Gen X)

(But everyone ignores our existence anyway...)

# The basic RS problem

At the very basic level, RS is the answer to a very simple GR problem:

$$S = \frac{1}{16 \pi G} \int d^{d+1}x \sqrt{g} (R - 2\Lambda) + \lambda \int d^d x \sqrt{g_I}$$

**Cosmological Constant**

**Einstein Gravity**

**Thin sheet with tension**

Today:  $d=4$ ; 3+1 dimensional brane in  $AdS_5$  with radius  $L$

# Quantum Mechanics Precursor:

Problem analog to  $\delta$ -function potential.

$$V(x) = -V_0\delta(x)$$

Away from potential: Vacuum

$$\psi(x) = \begin{cases} Ae^{\kappa x} & x < 0 \\ Ae^{-\kappa x} & x > 0 \end{cases}$$

Integrate Schrödinger: Jump condition

$$\left. \frac{d\psi}{dx} \right|_{+\epsilon} - \left. \frac{d\psi}{dx} \right|_{-\epsilon} = \frac{2m}{\hbar^2} V_0 \psi(0)$$

# Vacuum Solutions:

Away from the brane:  $\text{AdS}_5$  (or a slice thereof)

Across the brane:  $K_{\mu\nu} - h_{\mu\nu}K = 8\pi GT_{\mu\nu} = -4\pi G\lambda h_{\mu\nu}$   
(Israel '66)

**RS Spacetime** = 2 identical copies of (parts of)  $\text{AdS}_5$  glued together  
along brane

**Orbifolded RS Spacetime** = part of  $\text{AdS}_5$  terminated by brane

# (A)dS sliced Randall Sundrum

**Competition between bulk cc and brane tension leaves three options:**

$\lambda > \lambda_c \quad \Rightarrow \quad$  De Sitter Brane (supercritical)

$\lambda = \lambda_c \quad \Rightarrow \quad$  Minkowski Brane (critical)

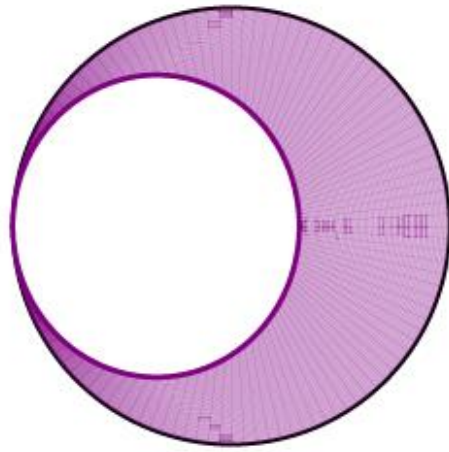

$\lambda < \lambda_c \quad \Rightarrow \quad$  Anti-De Sitter Brane (subcritical)

# Examples in (Euclidean) AdS

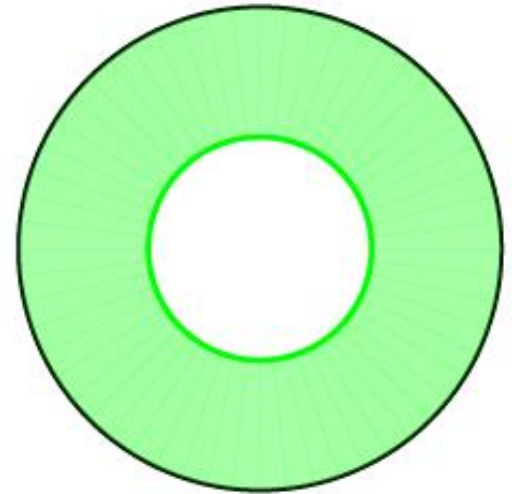

$$\lambda < \lambda_c$$

**“AdS brane”**

$$\lambda = \lambda_c$$

**“Minkowski brane”**

$$\lambda > \lambda_c$$

**“dS brane”**

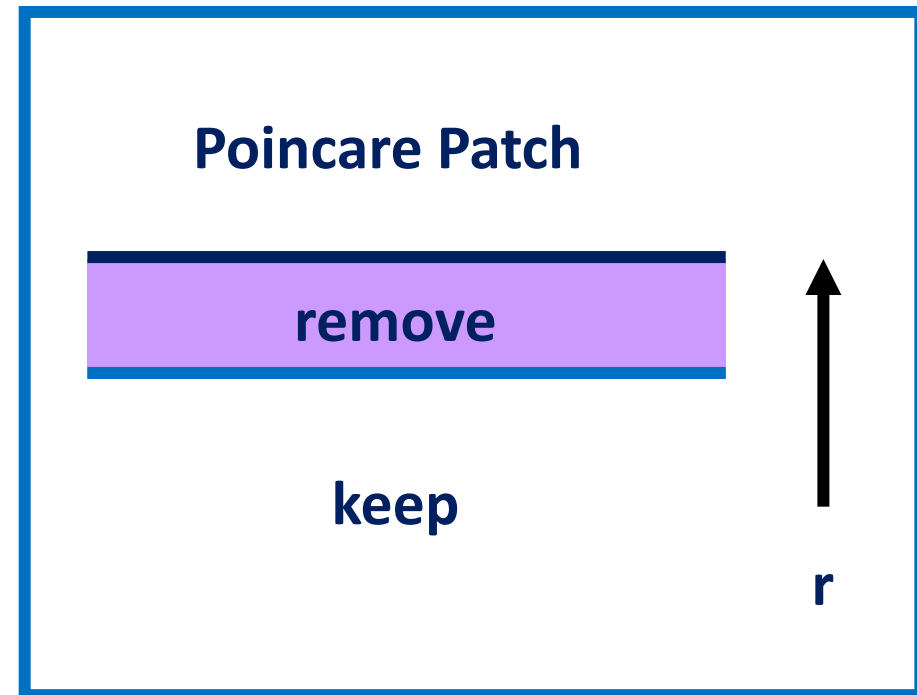

# Examples in (Euclidean) AdS

for positive tension brane

**orbifolded RS: keep  
(spacetime ends on brane)**

**2-sided RS: 2 copies of white region**

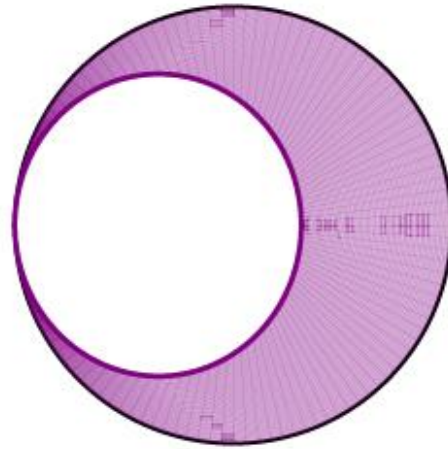

# Examples in (Euclidean) AdS

Interesting applications in

- Phenomenology
- Cosmology

Geometrizes Hierarchies

$$\lambda = \lambda_c$$

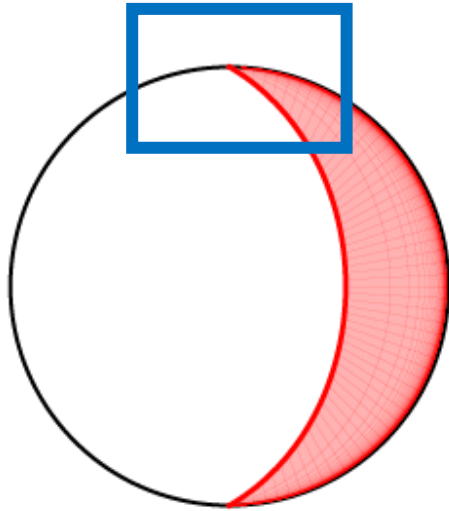

“Minkowski brane”

$$\lambda > \lambda_c$$

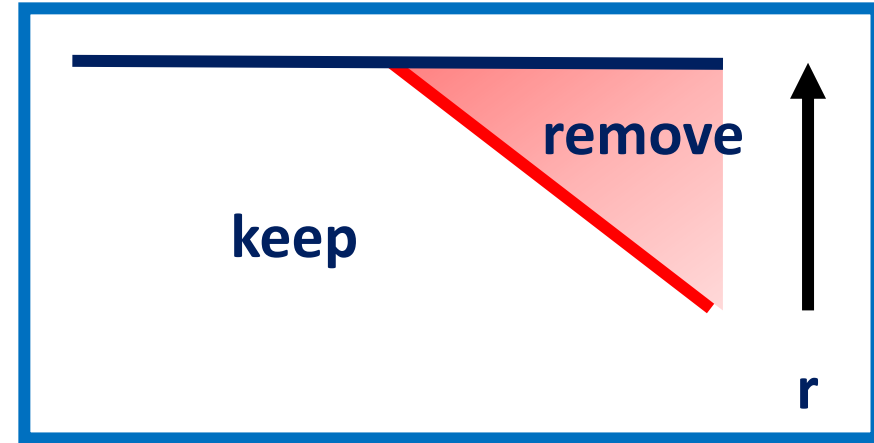

“dS brane”

# Examples in (Euclidean) AdS

$$\lambda < \lambda_c$$

**“AdS brane”**

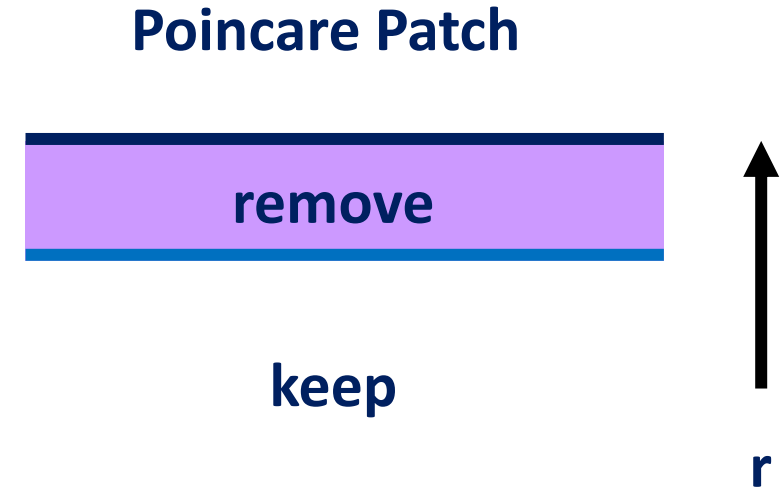

Subcritical RS brane:

- AdS/CFT with boundary
- Double Holography
- massive gravity

# Fluctuations and Holography

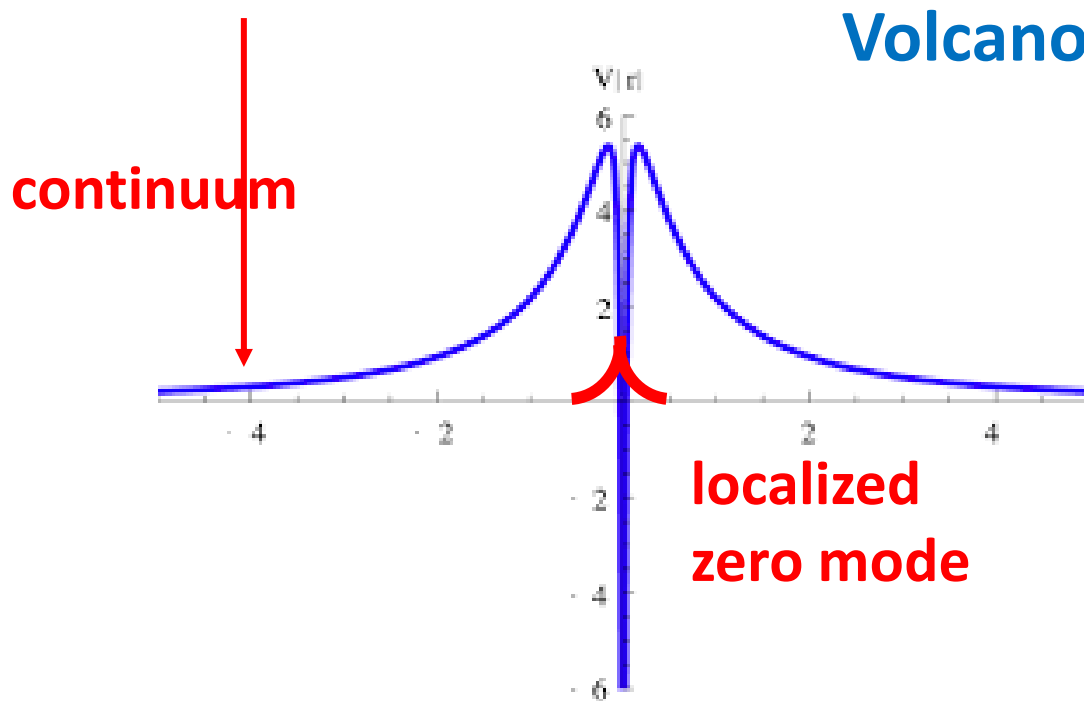

Essential features of **critical** RS:

- localized gravity
- holographic interpretation

Lays groundwork for subcritical setting of interest

# Randall Sundrum: graviton fluctuations

Small fluctuations of the metric around this solution give rise to a trapped, massless 3+1 - dimensional graviton on the brane

Linearized Einstein = Schrödinger with Volcano Potential

**An alternative to compactification!**

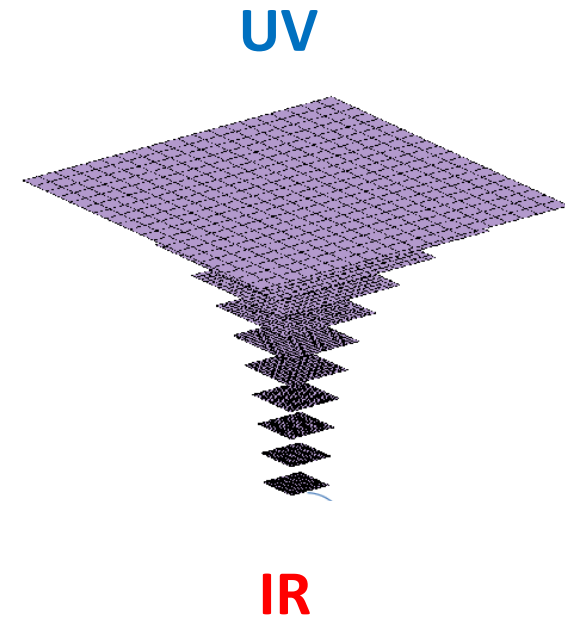

# Critical RS and holography

The connection with  $\text{AdS}_5$  suggests holographic description of critical RS:

Recall:

Gravity on  $\text{AdS}_5 = 3+1$  CFT on Boundary

radial direction in bulk = scale in CFT

# Randall-Sundrum Holography:

**Two (or one) copies of the IR part of  $\text{AdS}_5$ , glued together along a 3+1 dimensional brane with massless graviton trapped on brane.**

# Randall-Sundrum Holography:

(Gubser; Verlinde, Witten; ... '99)

**Two (or one) copies of the IR part of  $AdS_5$ , glued together along a 3+1 dimensional brane with massless graviton trapped on brane.**

The two IR regions

=

The RS or "UV" brane

**Two/one 4 dimensional CFTs with UV cutoff + dynamical gravity**

The localized graviton

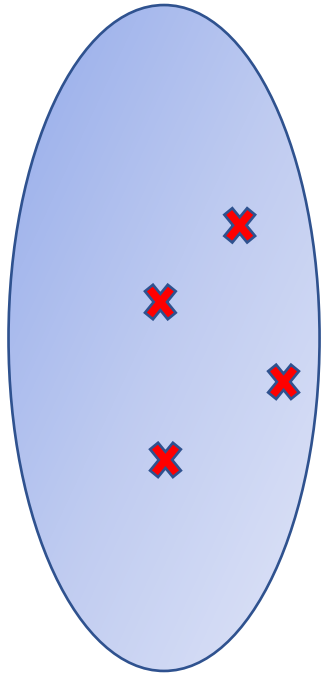

**Gravity part of holographic dual!!!**

# Top/Down (critical)RS Holography

(Verlinde '99)

base = RS brane

$N \gg 1$  D3 branes  
required for  
anomaly cancellation

6d base of  
IIB compactification

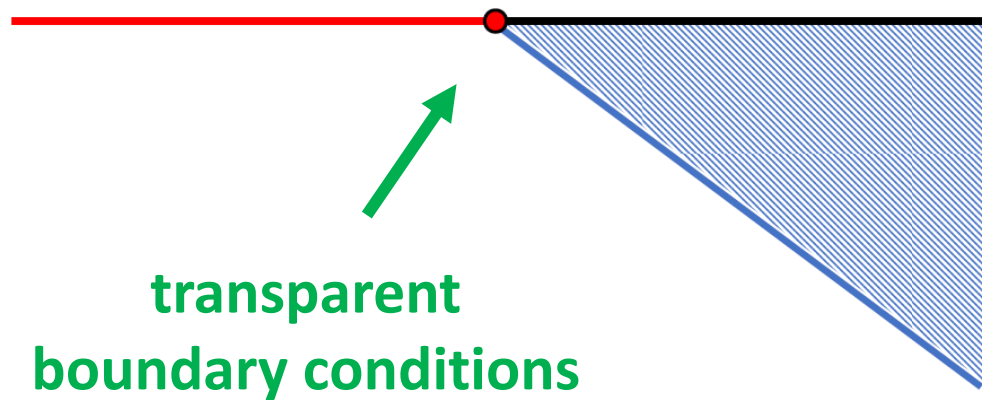

$AdS_5 \times S^5$  throat

D3's coincide

# Subcritical Holography

(AK, Randall '00)

Suggests 3 dual description

1. Classical Gravity of bulk + brane

RS holography

2. CFT + cutoff + gravity on AdS<sub>4</sub>  
communicating with CFT on half-space

dualize 3d DOFs

AdS<sub>4</sub> holography

3. CFT with boundary (AdS/BCFT)

# AdS/BCFT has in fact been proposed twice

## Open and closed string interpretation of SUSY CFT's on branes with boundaries #1

Andreas Karch (MIT, LNS), Lisa Randall (MIT, LNS) (Jul, 2000)

different philosophy, technically identical

# 2pt Correlators agree with BCFT structure

(Aharony, Dewolfe, Freedman, AK '03)

(Rastelli, Zhou '17)

Type I

Type II

Type III

- Decomposition of 5d fields in 4d modes = BOPE

(Aharony, Dewolfe, Freedman, AK '03)

- 2-pt function obeys block decomposition

(Rastelli, Zhou '17)

# Subcritical Holography

(AK, Randall '00)

**Solvable**

1. Classical Gravity of bulk + brane

**Gravity + Bath**

2. CFT + cutoff + gravity on AdS4  
communicating with CFT on half-space

**Well defined  
field theory**

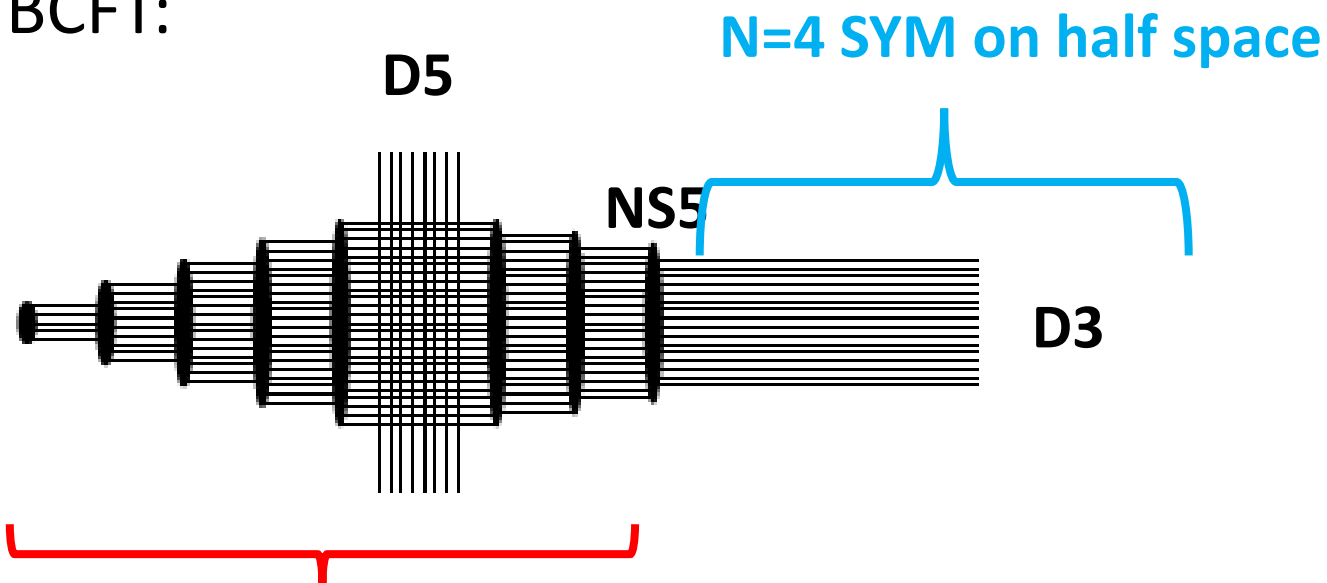

3. CFT with boundary (AdS/BCFT)

**“double holography”**

# Top/down AdS/BCFT

(UCLA-solution: D'Hoker, Estes, Gutperle '07, ....)

The BCFT:

$K/N_5$  allows to dial ratio of 4d/3d DOFs

boundary, 3d CFT

$$U(R) - U(2R) - \dots - U(R^2) - U(R^2 - S) - \dots - U(2N_5K + S) - \widehat{U(2N_5K)}$$

|  
[ $N_5$ ]

(Hanany, Witten '96)

(Gaiotto, Witten '09)

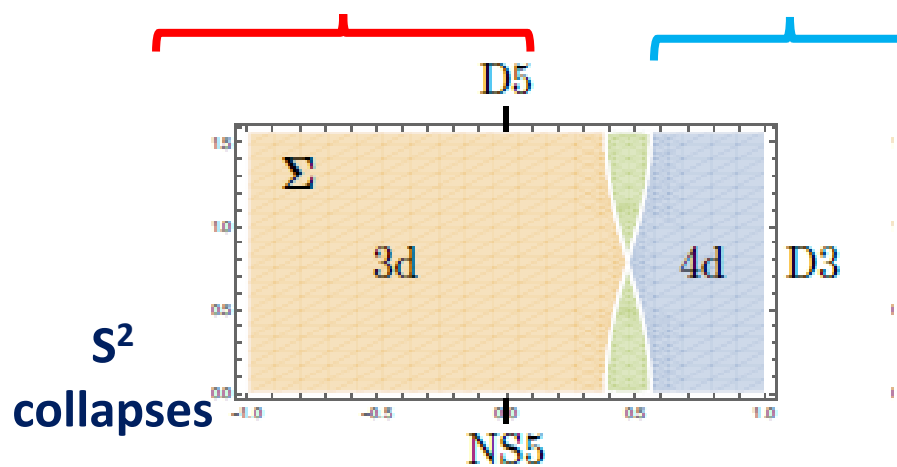

$$R = \frac{N_5}{2} + K \quad S = \frac{N_5}{2} - K .$$

# Top/down AdS/BCFT

(UCLA-solution: D'Hoker, Estes, Gutperle '07, ....)

keep

SU(2) x SU(2) R-symmetry:

$$AdS_4 \times S^2 \times S^2 \times \Sigma$$

metric functions/fields depend  
on 2d Riemann surface

# Fluctuations: the massive graviton

Linearized fluctuations: (AK, Randall '00)

While the subcritical RS brane still localizes a graviton, this time it has a non-zero mass!

Top-down: (Bachas, Lavdas'18)

Why? So What?

“And then they did dumps.  
They call ‘em dumps. Big,  
**massive** dumps.”

# Intermediate Picture Mass

(Porrati '02)

CFT + Gravity coupled to Bath:

- Answer depends on bc for matter
- Standard (reflecting) bc: no mass
- Any other bc (non-zero Transmission): graviton gets a mass!
- Higgs Mechanism for gravity; scalar gets eaten

Mass direct consequence of coupling to **bath**.

# The Photon analog

Consider a CFT with **U(1)** global symmetry, charged operator **W**

$$S = S_{CFT} + h \int d^d x W \quad \text{explicit breaking!}$$

Higgsing at  
tree level!

In the dual bulk, charged scalar profile from boundary value **h**

For gravity this also works: holographic lattice  $\rightarrow$  Gravity Higgsed

(Blake, Tong, Vegh '13)

But what if U(1) is broken by multi-trace?

$$S = S_{CFT} + h \int d^d x W^2$$

(double trace breaking)

$$S = S_{CFT1} + S_{CFT2} + h \int d^d x W_1 W_2$$

(double trace coupling to bath)

# The photon analog

(Rattazi, Redi '09)

- Matter loop = bi-linear condensate
- Standard Higgs mechanism
- Corresponds to deforming CFT by charged double trace (either within CFT or coupled to bath)

# Comments

- For a single scalar this mass is of order  $G \sim N^{-2}$
- RS branes have a CFT with  $N^2$  scalars, so mass of order 1
- While matter propagator only modified due to bc, the graviton/photon equation of motion changed everywhere
- effective action for graviton has explicit **Pauli Fierz mass term**

**Coupling to bath drives gravity/E&M into a Higgs phase.**

# BCFT Mass:

(Aharony, DeWolfe, Freedman, AK '03)

CFT with boundary (AdS/BCFT)

- $T_{4d} + T_{3d}$  conserved
- $T_{3d}$  alone not conserved
- anomalous dimension for  $T_{3d}$   
= graviton mass

verified by explicit calculations in string theoretic D3/D5 model

# Mass/Bath beyond AdS/BCFT

(Aharony, Clark, AK '06; Kiritsis '06)

Massless Graviton  
in AdS = Conserved Stress Tensor

coupling to bath →

non-conservation

can't have one without the other

Massive Graviton = anomalous dimension

Coupling to **bath** drives gravity/E&M into a Higgs phase.

# Mass/Bath made quantitative

(Aharony, Clark, AK '06)

$$S = S_{CFT1} + S_{CFT2} + h \int d^d x O_1 O_2$$

1-loop graviton  
mass

=

conformal perturbation  
theory for anomalous  
dimension of T  
to leading order in h

$$M_{grav}^2 = d (\Delta_T - d) = h^2 \left( \frac{1}{c_1} + \frac{1}{c_2} \right) \frac{\Delta_1 \Delta_2 d}{(d+2)(d-1)}$$

# Applications to BH Information

# Do black holes lose information?

# Recent Black Hole Revolution

**Unitary** evaporation of black holes (Page curve) from semi-classics:

yes, info  
does come back!

Ingredients: QES, Islands, Wormholes

Basic construction: (Pennington '19)

Concrete implementation:

$d=2$ : (Almheiri, Engelhardt, Marolf, Maxfield '19, ....)

2d gravity + bath

$d>2$ : (Almheiri, Mahajan, Santos '19)

bottom-up

(Uhlemann '19)

(Demulder, Gnechhi, Lavdas, Lust '21)

top-down

sub-critical RS branes!

# Recent Black Hole Revolution

**Unitary** evaporation of black holes (Page curve) from semi-classics:

yes, info  
does come back!

Ingredients: QES, Islands, Wormholes

All Page curves calculated to date  
were obtained in a theory in  
which gravity is in **Higgs phase!**

Basic construction: (Pennington '19)

Concrete implementation:

d=2: (Almheiri, Engelhardt, Marolf, Maxfield '19, ....)

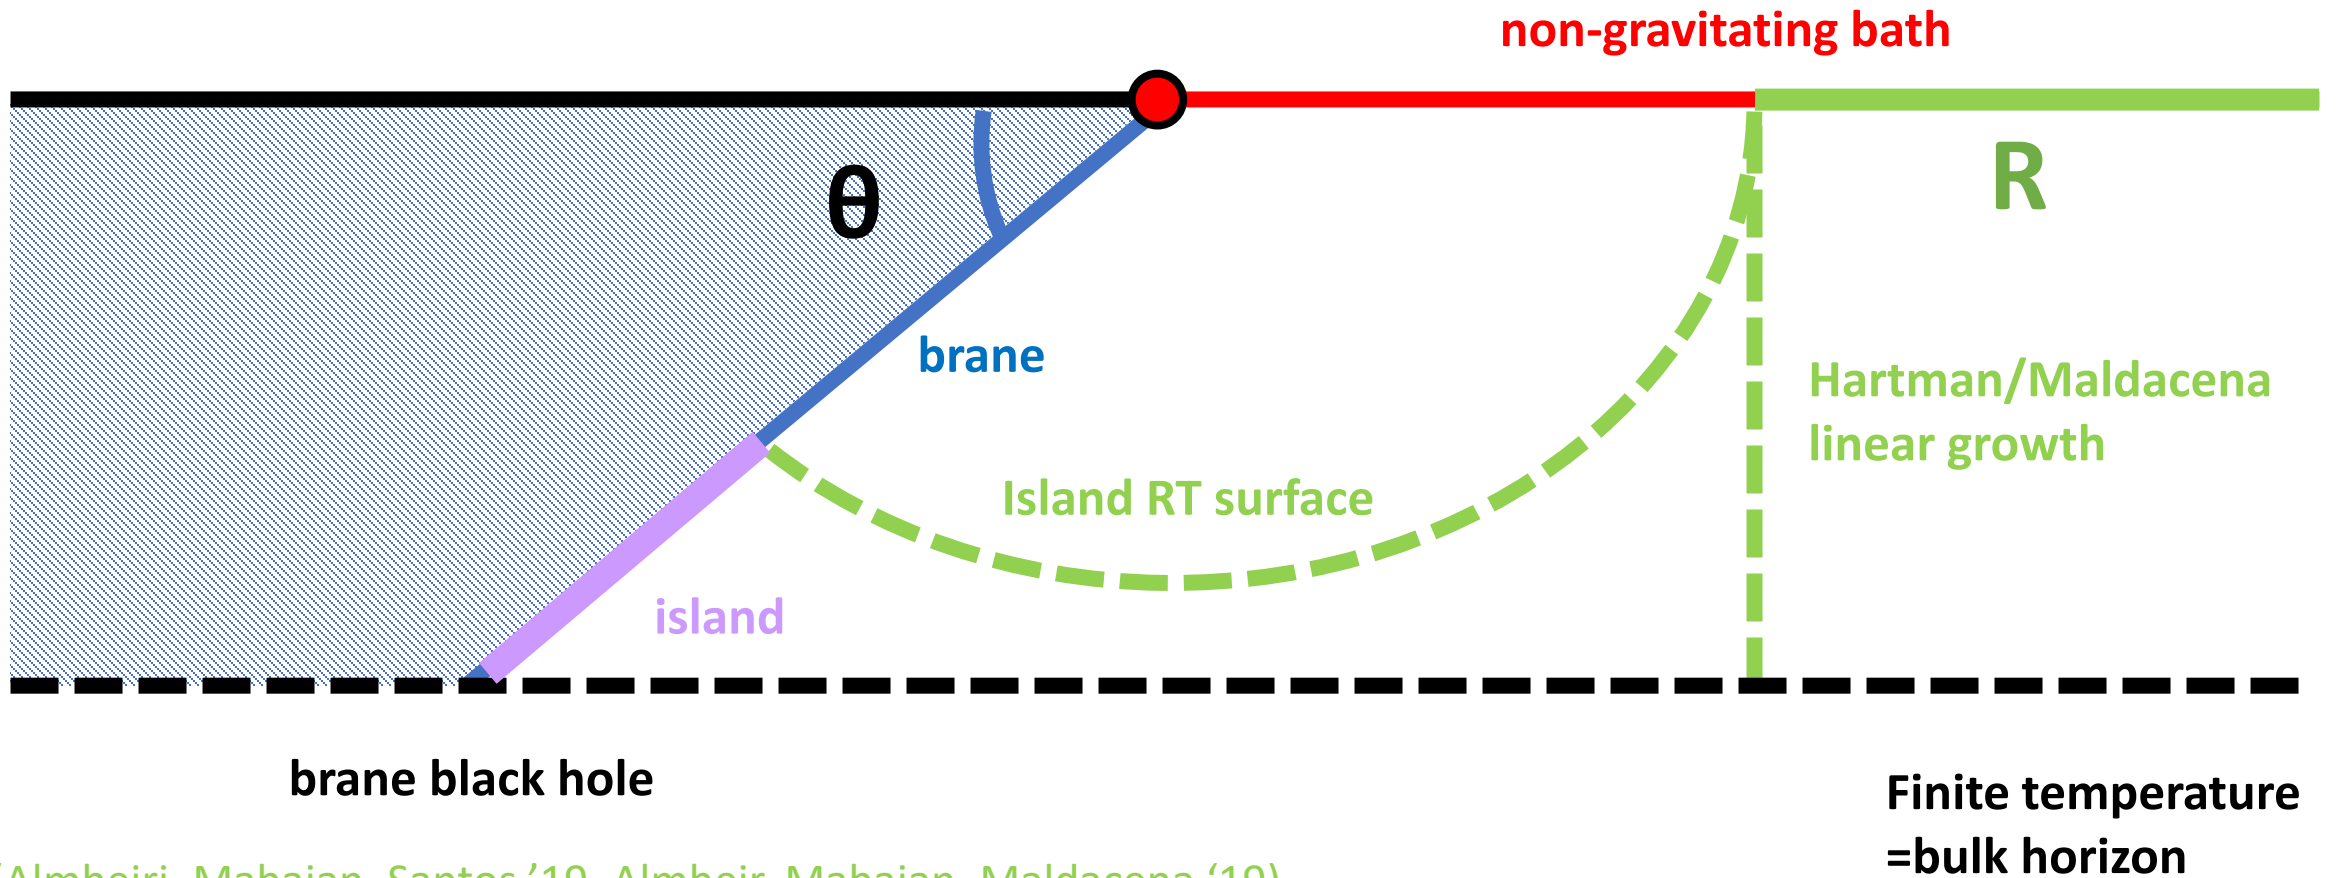

d>2: (Almheiri, Mahajan, Santos '19)

(Uhlemann '19)

(Demulder, Gnechhi, Lavdas, Lust '21)

gravity + bath

# Double Holographic Islands

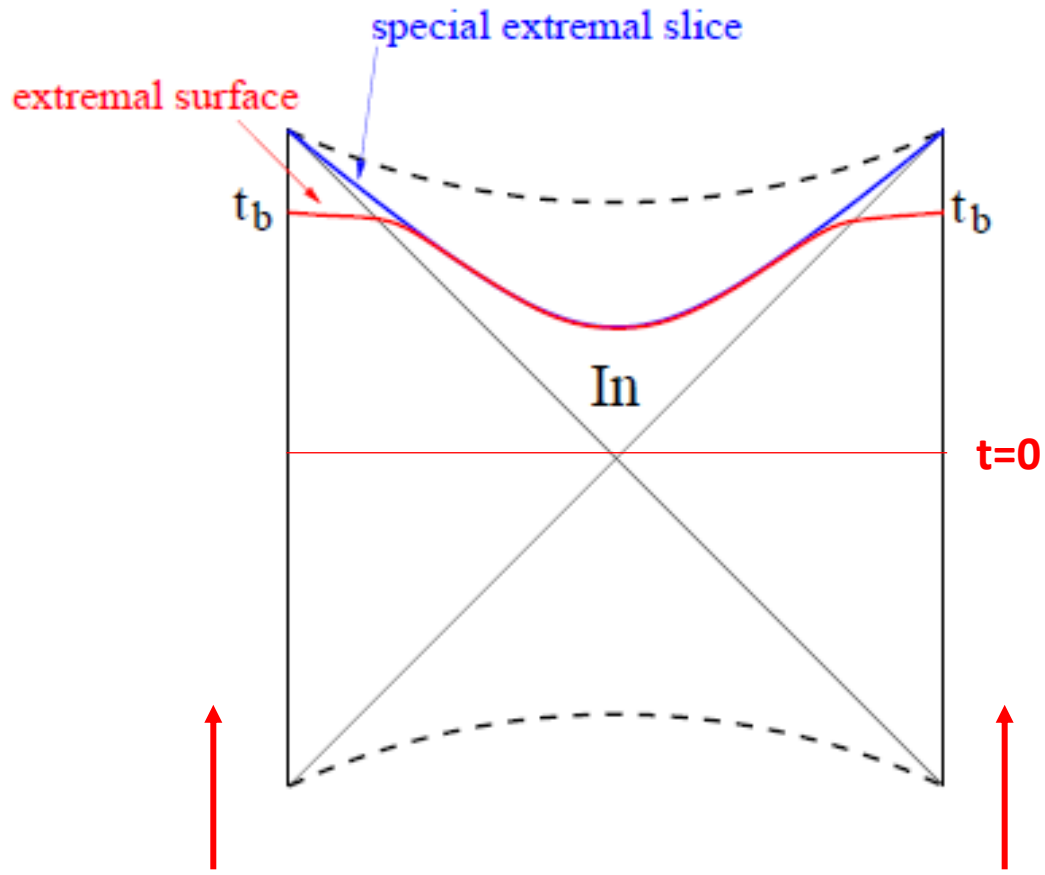

(Almheiri, Mahajan, Santos '19, Almheiri, Mahajan, Maldacena '19)

(Chen, Myers, Neuenfeld, Reyes, Sandor '20, Geng, AK, Perez, Raju, Randall, Riojas, Shashi '20)

# Paradox of the eternal black hole

(Hartman, Maldacena '13)

Take time running "up" on both sides  
Non-trivial time evolution.

Entanglement grows  
linear with time forever

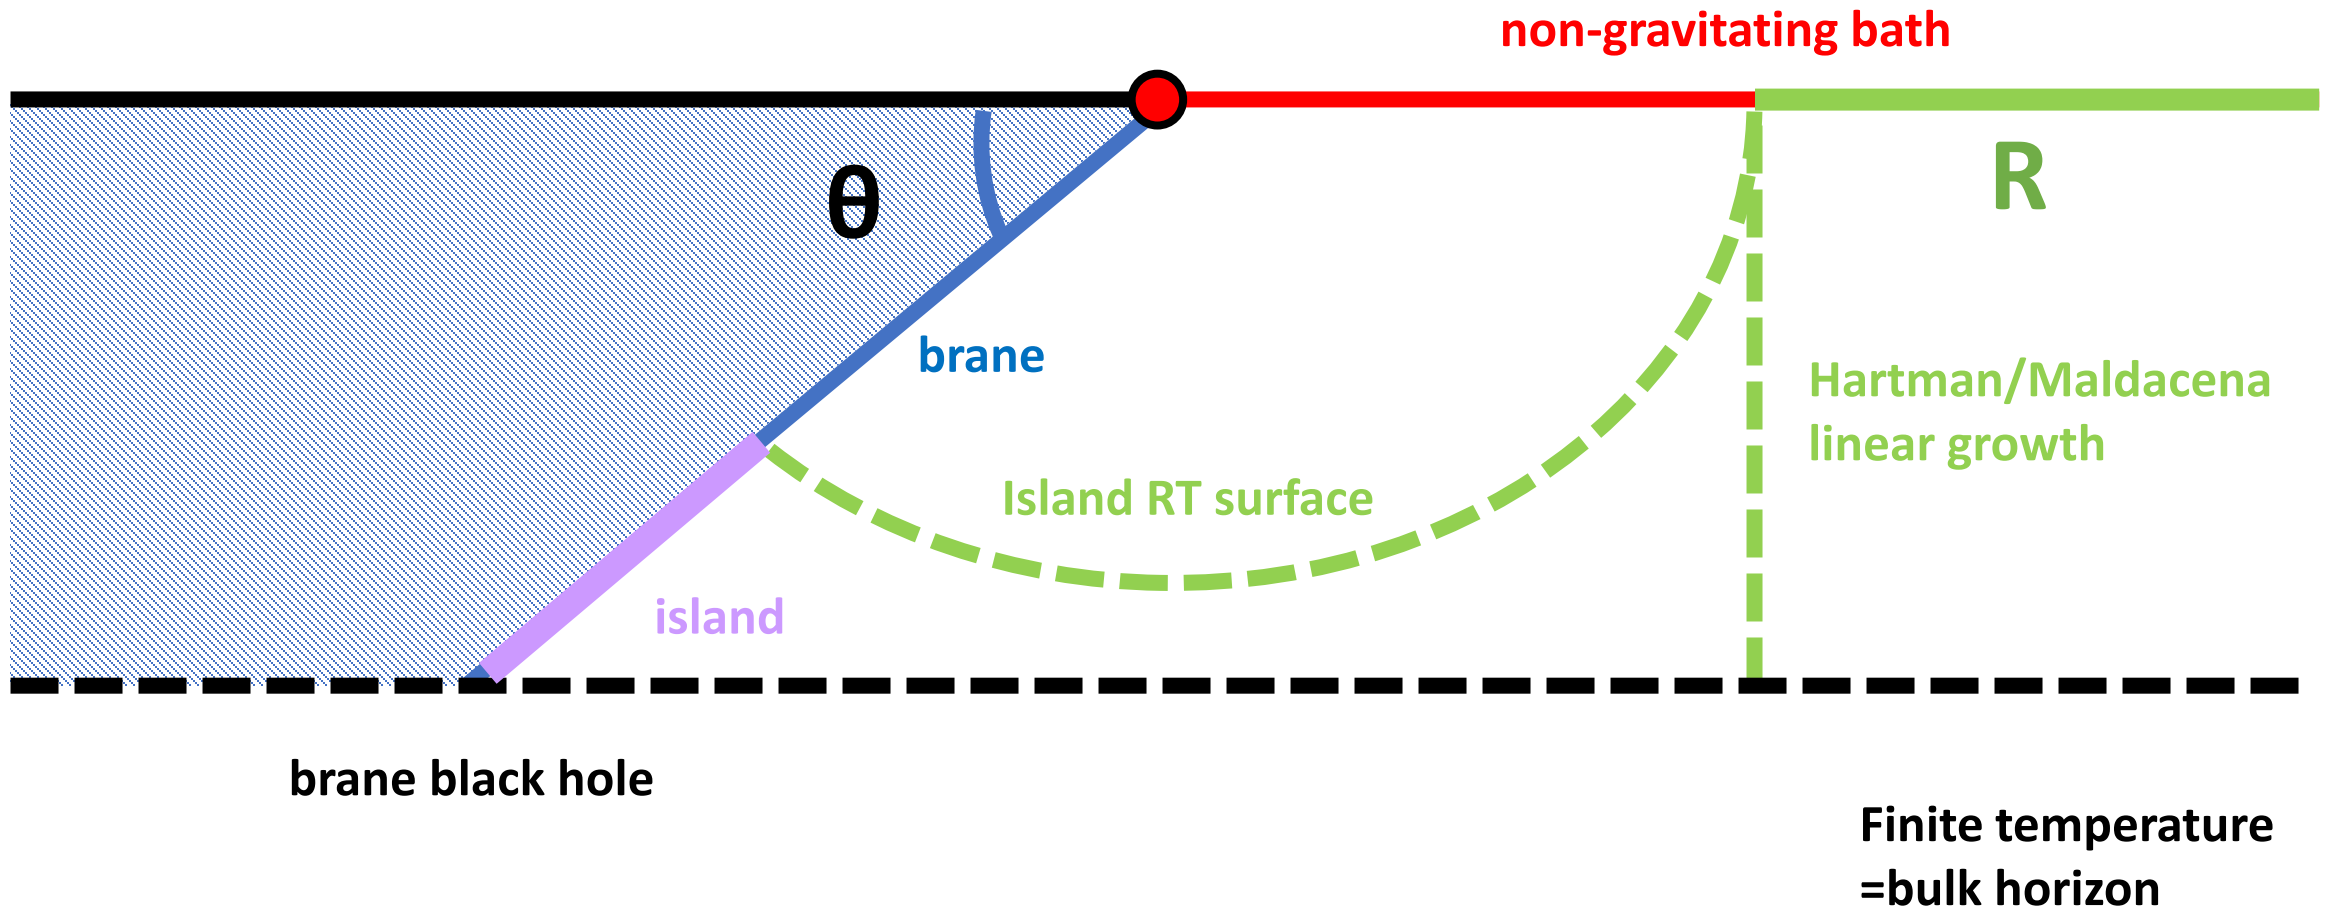

Puzzle: should saturate as  $S_{\text{BH}}$

# Entanglement Entropy

# Double Holographic Islands

(Almheiri, Mahajan, Santos '19)  
(Almheiri, Mahajan, Maldacena '19)

# Entanglement Entropy

Success: Page curve of gravity in its Higgs phase!

can also be seen in BCFT

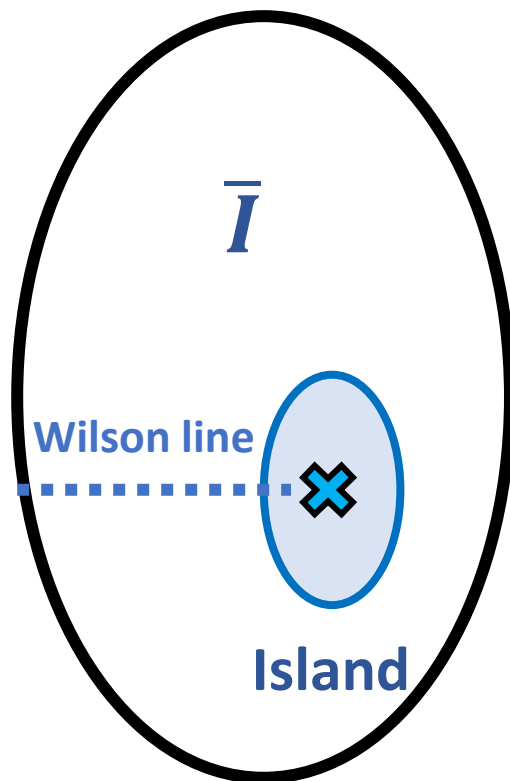

(Sully, Van Raamsdonk, Wakeham '20)

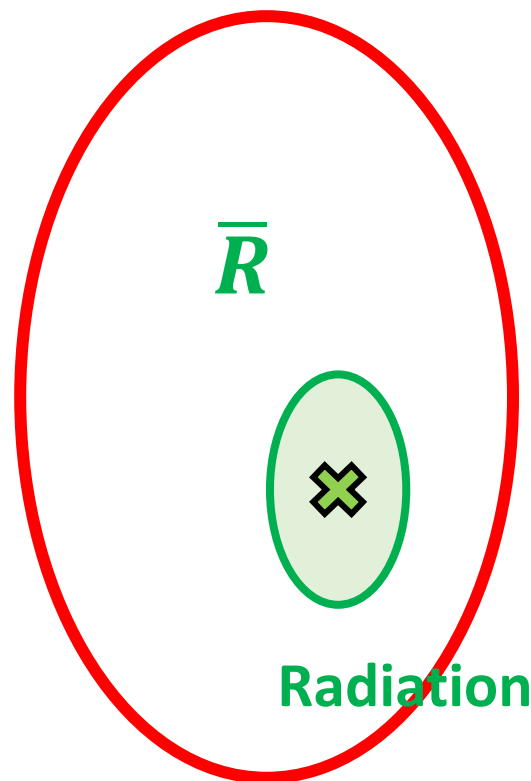

# Page curves without mass?

(Geng, AK, Perez, Raju, Randall, Riojas, Shashi '21)

**GRAVITY**

**BATH**

The fact that operators in the island need to be gravitationally dressed clashes with standard notions of Wedge reconstruction

**Claim:** no islands in massless gravity

But how come islands exist in RS?

**Excitation in I can be dressed to R via higher dimensional bulk!**

**In the intermediate picture this is represented as the screening by the graviton mass.**

# Gravity fails split property (Raju'21)

- Split property of QFT allows us to define EE in regions
- Massless gravity fails to satisfy split property
- Assuming it was the error in Hawking's original calculation
- Instead: in massless gravity all information accessible at infinity all the time

**Massless Gravity = Flat Page Curve**

# Quantum Information in Massless Gravity

- The problematic assumption is that one can meaningfully define the EE of a local region in a theory of gravity.
- Quantum effects due to dressing ambiguities go as  $G E^{d-2}$ . Precision required to resolve Page curve goes as  $e^{-S}$ . For black holes (unlike ordinary matter) these can not be separated.
- **Coupling to bath = Higgsing Gravity** resolves this tension.

Open problems

# Massless Page curves for other observables?

- Gauge invariant operators can be defined **relationally**. Local enough to see Page curve? (surely not in eternal black hole)

$$O = \int e^{-aR(x)^2} \psi(x)$$

- Define **coarse grained entropy** or gauge fixed observables directly in bulk instead of fine-grained EE of R. Clearly Page curve **can go up**. But can we find observable that sees it go down without getting a flat Page curve?

# Intermediate Dictionary?

Bulk and BCFT are sharply defined. But what about intermediate picture?

Bottom-up, 3d Dof  $\gg$  4d Dof: Generalized Differentiate Dictionary

(Neuenfeld '21)

Potential problem: **Shortcuts!**

(Omiya, Wei '21)

**bulk geodesic violates causality  
in naïve intermediate picture**

# Intermediate Dictionary?

(AK, Uhlemann, Sun '22)

Top-down gives an answer: dualize only 3d CFT!

Geometry genuinely different! **Is intermediate picture “on brane” possible?**

# Algebraic Approach

(Leutheusser, Liu '21, Witten '22)

$$U = H_R / N$$

At leading order in large N algebra of observables:

$$\mathcal{A}_R = \mathcal{A}_{R,0} \otimes \mathcal{A}_U$$

$$\mathcal{A}_L = \mathcal{A}_{L,0} \otimes \mathcal{A}_U$$

“type 3”: local fields in the bulk

Coupling to Bath?

$$S = S_{CFT1} + S_{CFT2} + h \int d^d x O_1 O_2$$

**U fails to commute with  
A even at leading order!**

(Fan, AK, ongoing)

**Higgsing? Islands?**

Thank you
