Mission Acronyms 2017 - 2023

ABFT	Aerodynamic Buffet Flight Test
ACES-2	Aurora Current and Electrodynamics Structure
APEP	Atmospheric Perturbations around Eclipse Path
ASPIRE	Advanced Supersonic Parachute Inflation Research and Experiments
AWESOME	Auroral Waves Excited by Substorm Onset Magnetic Events
AZURE	Auroral Zone Upwelling Rocket Experiment
BADASS	Black and Diffuse Aurora Science Surveyor
B-SPICE	Beam-Spacecraft Plasma Interaction and Charging Experiment
Beam-PIE	Beam - Plasma Interactions Experiment
CAPER-2	Cusp Alfvén and Plasma Electrodynamics Rocket
CHESS	Colorado High-resolution Echelle Stellar Spectrograph
CHI	Cusp Heating Investigation
CIBER-2	Cosmic Infrared Background Experiment
CLASP-2	Chromospheric Layer Spectro-Polarimeter 2
C-REX-2	Cusp-Region Experiment 2
DEUCE	Dual-channel Extreme Ultraviolet Continuum Spectrograph
DUST	Determining Unknown yet Significant Traits
DXL	Diffuse X-ray emission from the Local galaxy
ESIS	EUV Snapshot Imaging Spectrograph
EUNIS	Extreme Ultraviolet Normal-Incidence Spectrograph
EVEX	EUV Variability Experiment
EVEX	Equatorial Vortex Experiment
FORTIS	Far-ultraviolet Off Rowland-circle Telescope for Imaging and Spectroscopy
FOXSI	Focusing Optics X-ray Solar Imager
FURST	Full-Sun Ultraviolet Rocket Spectrograph
GHOST	Grand Challenge Mesosphere Student Rocket
GIRAFF	Ground Imaging to Rocket investigation of Auroral Fast Features
GNEISS	Geophysical Non-Equilibrium Ionospheric System Science rocket
HERSCHEL	Helium Resonance Scatter in the Corona and Heliosphere
ICI-5b	Investigation of CUSP Irregularities-5b
INCAA	Ion-Neutral Coupling During Active Aurora
INFUSE	Integral Field far-Ultraviolet Spectroscopic Experiment
ISINGLASS	Ionospheric Structuring: In Situ and Ground based Low Altitude Studies
KINET-X	Kinetic-scale Energy and momentum Transport Experiment
LAMP	Loss through Auroral Microburst Pulsations
LXT	Lobster-Eye X-Ray Telescope
MaGIXS	Marshall Grazing Incidence X-ray Spectrometer
MAV-FT	Mars Ascent Vehicle - Flight Test
Ox-FORTIS	Off Axis Far-ultraviolet Off Rowland-circle Telescope for Imaging and Spectroscopy
OGRE	Off-Plane Grating Rocket Experiment
POLARNOX	Polar Night Nitric Oxide
XQC	X-ray Quantum Calorimeter
RAISE	Rapid Acquisition Imaging Spectrograph Experiment
REDSOX	Rocket Experiment Demonstration of a Soft X-ray Polarimeter
SEED	Sporadic E Electrodynamics
SHIELDS	Spatial Heterodyne Interferometric Emission Line Dynamics Spectrometer
SHIMCO	Spatial Heterodyne Interferometric Molecular Cloud Observer
SISTINE	Suborbital Imaging Spectrograph for Transition region Irradiance from Nearby Exoplanet host stars
SMART	Space Measurement of Rocket-released Turbulence
SNIFS	Solar eruption Integral Field Spectrograph
SOFE	Suborbital Flight Experiment
SUBTEC 7	Sub-orbital Technology
TOMEX-Plus	Turbulent Oxygen Mixing Experiment-Plus
IREXS	The Rockets for Extended-source X-ray Spectroscopy
TRICE-2	Twin Rockets to Investigate Cusp Electrodynamics
USIP	University Student Instrument Program
VERIS-2	Very high angular Resolution Imaging Spectrograph
VIPER	Vlf trans-Ionospheric Propagation Experiment Rocket
Vortex	Vorticity Experiment
VISIONS 2	Visualizing Ion Outflow via Neutral atom imaging during a Substorm
WINDY	Waves and Instabilities from a Neutral Dynamo
WRX-R	Water Recovery X-ray Rocket

Mission Names (not acronyms)

JETS	Neutral Jets Associated with Auroral Arcs
MICRO-X	X-ray Microcalorimeter
SUPER SOAKER	Transport, Chemistry, and Energetics of Water in the Mesosphere and Lower Thermosphere and Implications for Polar Mesospheric Cloud Occurrence (aka Super Soaker)
ENDURANCE	Mission is named after Ernest Shackleton's ship Endurance.
Apophis	Apophis: Rocket campaign to investigate eclipse induced ionospheric electrodynamics

<u>MISSION</u>	<u>EXPERIMENTER</u>	<u>PROJECT</u>	<u>SCIENCE DESCRIPTION</u>
12.081 DR	CREEKMORE	ZOMBIE	The purpose of the Zombie missions is to conduct flight tests of new guided vehicle configurations for use as DOD targets and defense systems testing. The 12.081 mission will be the first test flight for the guided Pathfinder configuration that utilizes a MK70 first stage booster. The MK70 enhances performance and increases range capabilities.
12.085 DR	CHRISLEY	ZOMBIE	The purpose of the Zombie missions is to conduct flight tests of new guided vehicle configurations for use as DOD targets and defense systems testing. The 12.085 and 12.086 missions are the first two guided launches to be used as actual targets. Defense systems will be used to engage the vehicles in flight.
12.086 DR	CHRISLEY	ZOMBIE	The purpose of the Zombie missions is to conduct flight tests of new guided vehicle configurations for use as DOD targets and defense systems testing. The 12.085 and 12.086 missions are the first two guided launches to be used as actual targets. Defense systems will be used to engage the vehicles in flight.
21.144 UE 21.145 UE	PFAFF	DYNAMO-2	Two identical instrumented payloads will be launched to an apogee of 135 km with instruments to measure DC electric fields, plasma density, currents, neutral winds, neutral density, temperature and ions mass distribution. Additionally, data from the ICON satellite, ground based magnetometers, and ionosonde will be incorporated in this mission.
29.042 UE	HYSELL	WINDY	The science goals for the WINDY (Waves and Instabilities from a Neutral Dynamo) equatorial spread F (ESF) missions are to study the stability of the post sunset equatorial F region ionosphere and the factors that predispose it to equatorial spread F, a spectacular phenomenon characterized by broadband plasma turbulence which degrades radio and radar signals at low magnetic latitudes. The goal of the investigation is to lay the foundation for a strategy to forecast this disruptive phenomenon.
35.039 GE	ROWLAND	VISIONS 2	The purpose of the VISualizing Ion Outflow via Neutral atom Sensing-2 (VISIONS-2) missions is to study the nature and extent of low altitude ion outflow (>10 eV) from the cusp. The investigation will determine the spatial and temporal variations of ion outflow; the total energetic ion outflow in the remotely sensed volume; and how regions of enhanced ion outflow compare in detail to the locations of field aligned currents, optical auroral emissions, enhanced electric fields, energetic particle precipitation, wave activity, and regions of enhanced/depressed electron density.
35.040 GE	ROWLAND	VISIONS 2	The purpose of the VISualizing Ion Outflow via Neutral atom Sensing-2 (VISIONS-2) missions is to study the nature and extent of low altitude ion outflow (>10 eV) from the cusp. The investigation will determine the spatial and temporal variations of ion outflow; the total energetic ion outflow in the remotely sensed volume; and how regions of enhanced ion outflow compare in detail to the locations of field aligned currents, optical auroral emissions, enhanced electric fields, energetic particle precipitation, wave activity, and regions of enhanced/depressed electron density.
35.041 GE 35.042 GE	COLLINSON	Endurance	The goal of the Endurance mission is to make the first measurement of the magnitude and structure of the electric field generated by Earth's ionosphere.

36.245 UH	FIGUEROA	MICRO-X	The Micro-X sounding rocket payload will obtain the first imaging X-ray microcalorimeter spectra from an astronomical source. The microcalorimeter array and associated transition edge sensors (TES) will be cooled to a temperature of about a hundredth of a degree above absolute zero by utilizing an Adiabatic Demagnetization Refrigerator (ADR). The first flight of Micro-X will investigate the plasma conditions (such as temperature, electron density and ionization) and the velocity structure of the Bright Eastern Knot of the Puppis A Supernova remnant (SNR). It will also search for the presence of supernova ejecta, measure or place upper limits on turbulent flows, and measure bulk motions of the plasma.
36.262 UG	KAISER	ACCESS #1	The Absolute Color Calibration Experiment for Standard Stars (ACCESS-1), is the first of four flights of a new payload to obtain absolute spectrophotometric calibration of the National Institute of Standards and Technology (NIST) laboratory irradiance standards to a precision of 1% in the 0.35 – 1.7 μ m bandpass at a spectral resolution greater than 500 by directly tracing the observed stellar fluxes to NIST laboratory irradiance standards. Transfer of the NIST detector standards to the target stars will produce an absolute calibration of these standards in physical units, including the historic absolute standard Vega. This improved network of standard stars, extending to 10 th magnitude, will be available to all telescopes as standard sources.
36.281 UG	BOCK	CIBER-2	The primary scientific objective of the <u>C</u> osmic <u>I</u> nfrared <u>B</u> ackground <u>E</u> xpe <u>R</u> iment (CIBER-2) mission is to conduct a deep multi-band search for extragalactic background fluctuations from the first generation of stars. These first stars and their remnants are likely responsible for the reionization of the intergalactic medium, which is observed to be ionized out the most distant quasars at a redshift of 6.
36.298 UH	MCENTAFFER	OGRE	The purpose of the Off-Plane Grating Rocket Experiment (OGRE) mission is to observe Capella in the soft X-ray spectrum and to flight test the instrument concept of the Off-Plane Grating Spectrometer for use on future X-ray missions.
36.301 GE	PFAFF	JETS	The purpose of the JETS investigation is to understand the height-dependent coupling processes that create localized neutral “jets” in the upper atmosphere associated with the aurora, their driving conditions, and their associated heating and neutral structuring.
36.302 UE	BAILEY	POLARNOX	The purpose of Polar Night Nitric Oxide (Polar NOx) experiment is to measure the concentration of nitric oxide in the mesosphere and lower thermosphere in the nighttime polar region. The reason this experiment needs to be conducted in the polar region is twofold. First, the NO is created by the reaction of atomic nitrogen (N) and O ₂ . A major source of atomic nitrogen (N) is auroral energetic electrons impacting Nitrogen (N ₂) and splitting the atom into two. Secondly, the primary destruction mechanism of NO is photo dissociation and thus in the absences of sunlight, the NO loss mechanism disappears. Hence, the experiment needs to be conducted in the polar region at night to measure what is expected to be peak concentrations of NO.
36.303 UE	LYNCH	ISINGLASS	The purpose of the Ionospheric Structuring: In Situ and Ground Based Low Altitude Studies (ISINGLASS) investigation is to study how auroral energy sources impact ionospheric response gradients and the effects of ionspheric structures on M-I coupling.

36.304	UE	LYNCH	ISINGLASS	The purpose of the Ionospheric Structuring: In Situ and Ground Based Low Altitude Studies (ISINGLASS) investigation is to study how auroral energy sources impact ionospheric response gradients and the effects of ionospheric structures on M-I coupling.
36.306	GE	PFAFF	JETS	The purpose of the JETS investigation is to understand the height-dependent coupling processes that create localized neutral “jets” in the upper atmosphere associated with the aurora, their driving conditions, and their associated heating and neutral structuring.
36.307	DS	TUN	HERSCHEL	The scientific objectives of the HERSCHEL II mission are to: 1) Investigate the origin of the slow solar wind; 2) Investigate the variation of helium abundance in the coronal structures (a) departures from primordial composition (b) fractionation region for helium in the solar atmosphere; 3) Facilitate future investigation of Coronal Mass Ejections (CMEs), kinematics, and solar cycle evolution of the electron, proton, and helium corona.
36.309	US	HASSLER	RAISE	The Rapid Acquisition Imaging Spectrograph Experiment (RAISE) Sounding Rocket payload is a high speed scanning-slit imaging spectrograph designed to observe and analyze dynamics and heating of the solar chromosphere and corona. RAISE is a UV/EUV Imaging Spectrographs that use only two reflections to provide high cadence stigmatic imaging over multiple wavelengths and spatial fields simultaneously. This third flight will explore active region loop dynamics, high frequency waves in the corona and mechanisms of small scale energy release.
36.311	UG	GREEN	DEUCE	The goal of the DEUCE (Dual-channel Extreme Ultraviolet Continuum Spectrograph) mission is to measure the amount of the Lyman continuum (LyC) radiation that is being produced by the only two non-white-dwarf stars in our galaxy known to have a sufficiently low enough neutral hydrogen column density to measure their ionizing radiation directly. The results of this mission will help to answer one of the major questions of modern astrophysics concerning how and when galaxies first formed and how did their formation “feedback” into their circumgalactic environments to modify early galaxy formation during the Epoch of Re-ionization at $Z=6-11$.
36.317	GP	HESH	SUBTEC 7	The primary objectives of the SubTec7 flight are to demonstrate the NSROC Forward OGIVE Recovery System (N-FORSe) with a representative vehicle and payload prior to the need date for science missions, and to perform water recovery on a representative BBIX telescope payload. The secondary objectives of this mission are to provide NASA and NSROC an opportunity to test new technology experiments.
36.319	NS	WINEBARGER	MaGIXS	The purpose of the Marshall Grazing Incidence X-ray Spectrometer (MaGIXS) mission is to determine the frequency of heating in active region cores of the Sun by observing different solar structures to establish: the relative amount of high-temperature plasma; the elemental abundance; the temporal variability at high temperatures; and the likelihood of Maxwellian or non-Maxwellian distributions.
36.320	US	KANKELBORG	ESIS	The purpose of the ESIS/MOSES mission is to make direct observations of the Sun surface to view explosive events, reconnection, and waves in the solar transition region. This will be achieved by using two instruments that are designed to map Doppler shifts and line widths over a wide field view and at rapid cadence.

36.321	UE	HYSELL	WINDY	The science goals for the WINDY (Waves and Instabilities from a Neutral Dynamo) equatorial spread F (ESF) missions are to study the stability of the post sunset equatorial F region ionosphere and the factors that predispose it to equatorial spread F, a spectacular phenomenon characterized by broadband plasma turbulence which degrades radio and radar signals at low magnetic latitudes. The goal of the investigation is to lay the foundation for a strategy to forecast this disruptive phenomenon.
36.322	GS	DAW	EUNIS	The purpose of the EUNIS (Extreme Ultraviolet Normal-Incidence Spectrograph) mission is to: 1) probe the structure and dynamics of the solar corona with high cadence enabled by unprecedented sensitivity (100 times the throughput of the highly successful SERTS payload that preceded EUNIS); 2) study diagnostics of wave heating and reconnection in the solar wind acceleration region and inner corona; and 3) provide absolute intensity calibration of orbital instruments such as Hinode/EIS, SOHO/CDS, SDO/AIA.
36.323	UG	FRANCE	CHESS	The Colorado High-resolution Echelle Stellar Spectrograph (CHESS-3) mission will be the third flight of a payload designed to enable new scientific studies of the local interstellar medium. The CHESS instrument allows for observations of the local interstellar medium by observing nearby stars that are too bright for the Hubble Space Telescope or the Far Ultraviolet Spectrograph Explorer (FUSE) satellite, thus providing detailed composition and temperature maps at the diffuse/transitional interstellar medium boundary for the first time.
36.324	US	HARRIS	SHIELDS	The purpose of the Spatial Heterodyne Interferometric Emission Line Diagnostic Spectrometer (SHIELDS) mission is to study the physics associated with the Heliopause, which is the point where the Local interstellar Cloud (LIC) and solar wind plasmas meet. It will accomplish this by taking measurements of Hydrogen Lyman-alpha (H Ly- α) light reflected by interplanetary hydrogen (IPH).
36.325	US	GLESENER	FOXSI	The purpose of the Focusing Optics X-ray Solar Imager (FOXSI) mission is to measure High-energy X-rays and photon energies from the “quiet” part of the Sun.
36.326	NR	CLARK	ASPIRE	The purpose of the ASPIRE series of missions (36.326, 27, & 28) is to demonstrate the high velocity deployment of parachute systems towards the ultimate goal of developing a system that can be utilized to land payloads onto the surface of Mars.
36.327	NR	CLARK	ASPIRE	The purpose of the ASPIRE series of missions (36.326, 27, & 28) is to demonstrate the high velocity deployment of parachute systems towards the ultimate goal of developing a system that can be utilized to land payloads onto the surface of Mars.
36.328	NR	CLARK	ASPIRE	The purpose of the ASPIRE series of missions (36.326, 27, & 28) is to demonstrate the high velocity deployment of parachute systems towards the ultimate goal of developing a system that can be utilized to land payloads onto the surface of Mars.
36.329	UH	GALEAZZI	DXL	The purpose of the Diffuse X-Rays from the Local Galaxy (DXL-3) mission is to study the physics associated with the Solar Wind Charge Exchange (SWCX) and the Local Hot Bubble (LHB). The investigation will obtain geometric measurements of the SWCX and differentiate the foreground SWCX emission from the background LHB emissions. It will also determine the compound cross section with helium and hydrogen.

36.330 UH	MCENTAFFER	WRX-R	The Water Recovery X-ray - Rocket (WRX-R) is a X-ray spectroscopy payload that is capable of providing moderate spectral resolution, $R(\lambda/\Delta\lambda) \approx 30$ and will be used to study the Vela Supernova Remnant on a flight from Kwajalein, Marshall Islands. The mission will attempt to measure the key lines that indicate the temperature and ionization state of this plasma. Characterization and comparison of the soft X-ray emission will lead to a more complete understanding of the evolution of supernova remnants and their interaction with the surrounding interstellar medium as well as shedding light on matter and energy feedback in the galaxy in general.
36.331 UG	GREEN	DEUCE	The goal of the DEUCE (Dual-channel Extreme Ultraviolet Continuum Spectrograph) mission is to measure the amount of the Lyman continuum (LyC) radiation that is being produced by the only two non-white-dwarf stars in our galaxy known to have a sufficiently low enough neutral hydrogen column density to measure their ionizing radiation directly. The results of this mission will help to answer one of the major questions of modern astrophysics concerning how and when galaxies first formed and how did their formation “feedback” into their circumgalactic environments to modify early galaxy formation during the Epoch of Re-ionization at $Z=6-11$. This mission is a re-fly of 36.311 UG.
36.332 NS	MCKENZIE	CLASP-2	The Chromospheric LAYER Spectro-Polarimeter 2 (CLASP2) mission will serve as a pathfinder for potential satellite missions to measure the magnetic field in the upper chromosphere and transition region of the Sun, by extending spectro-polarimetric measurements to UV lines with a range of magnetic sensitivities relevant for field strength found in this layer of the solar atmosphere. CLASP2 will measure all four Stokes parameters in the 280nm range to study wavelength-dependent variations in polarization caused by the joint action of scattering processes and the Hanle and Zeeman effects.
36.333 UG	FRANCE	CHESS	The Colorado High-resolution Echelle Stellar Spectrograph (CHESS) is designed to study the interstellar medium (ISM) in the ultraviolet part of the spectrum, the matter between stars, and specifically translucent clouds of gas which provide fundamental building blocks for star and planet formation. These clouds have very low densities and the only way to study them is to measure absorption spectra of light from stars passing through the cloud. CHESS will be pointed at the star Gamma Ara, in the southern constellation Ara. With this fourth flight of the Colorado High-resolution Echelle Stellar Spectrograph (CHESS-4) sounding rocket payload, sightlines at the lower-edge of the translucent cloud regime can be sampled. This mission aims to study translucent clouds by analyzing the ultraviolet absorption spectra of the two most abundant molecules (H_2 and CO) that reside within them.
36.334 NR	CLARK	ASPIRE	The purpose of the ASPIRE series of missions (36.326, 27, & 28) is to demonstrate the high velocity deployment of parachute systems towards the ultimate goal of developing a system that can be utilized to land payloads onto the surface of Mars.
36.336 UE	WOODS	EVE	The primary objective for this mission is to provide an underflight calibration for the EUV Variability Experiment (EVE) aboard the NASA Solar Dynamics Observatory (SDO) satellite. The EVE program provides solar EUV irradiance data for NASA’s Living With the Star (LWS) program, including near real-time data products for use in operational atmospheric models that specify the space environment and to assist in forecasting space weather operations.

36.337 DS	KORENDYKE	VERIS-2	VERIS-2 combines very high spatial resolution (0.32" or 240 km) with spectroscopic observations of emission lines formed in the chromosphere, transition region, and corona (931-1076 A) at high cadence (5s nominal). By combining high spatial and spectral resolution with high cadence the investigation will measure the time-dependent transition region velocity structure in active region moss. Spectrometer measurements will investigate the origins of high temperature active region plasma by observing the Doppler signatures of nano flare and Alfvén wave heating in the corona.
36.335 CE 41.123 CE 41.124 CE	CLEMMONS	TOMEX-Plus	Turbulent Oxygen Mixing Experiment-plus (TOMEX-Plus) builds on the TOMEX mission launched in 2000 from WSMR and examines how turbulence and mixing of atomic oxygen are related to each other and to underlying instabilities. TOMEX-Plus aims to determine how the vertical profile of the atomic oxygen mixing ratio varies as the atmosphere changes from regions of large layered turbulence at or below the mesopause to decreasing and possibly vanishing turbulence around the turbopause. Additionally, the horizontal variations in the atomic oxygen density that can be related to variations in turbulent fluctuations are studied. TOMEX-Plus will also characterize the 3D turbulence spectrum, its spatial variability and relationship to larger scale features of the flow, especially those related to instabilities.
36.339 UG 36.340 DR	FRANCE ABBETT	SISTINE	Investigation of low-mass star UV environments and their effects on potential exoplanet atmospheres. This mission will test high definition cameras to view free flying test objects ejected from the payload under exo-atmospheric conditions.
36.341 UH	MCENTAFFER	WRX2	The Water Recovery X-ray rocket (WRX-2) is a X-ray spectroscopy payload that is capable of providing moderate spectral resolution, $R(\lambda/\Delta\lambda) \approx 30$ and will be used to study the Vela Supernova Remnant on a flight from Australia. The mission will attempt to measure the key lines that indicate the temperature and ionization state of this plasma. Characterization and comparison of the soft X-ray emission will lead to a more complete understanding of the evolution of supernova remnants and their interaction with the surrounding interstellar medium as well as shedding light on matter and energy feedback in the galaxy in general.
36.342 NS	WINEBARGER	Hi-C 2	The purpose of this sounding rocket mission is to identify the connections between the solar corona and the cooler chromosphere and transition region. Hi-C 2 will observe the high transition region/low corona at the same resolution as IRIS.
36.343 GG	NUTH	DUST	Measure important variables in the end-to-end process of grain formation in circumstellar outflows around AGB stars and model the physical and chemical properties of the dust.
36.344 UE 36.345 UE	HYSELL	TooWINDY	The science goals for the TooWINDY (Waves and Instabilities from a Neutral Dynamo 2) equatorial spread F (ESF) missions are to study the stability of the post sunset equatorial F region ionosphere and the factors that predispose it to equatorial spread F, a spectacular phenomenon characterized by broadband plasma turbulence which degrades radio and radar signals at low magnetic latitudes. The goal of the investigation is to lay the foundation for a strategy to forecast this disruptive phenomenon.
36.346 UG 36.347 UH	FRANCE MCCAMMON	SISTINE XQC	Investigation of low-mass star UV environments and their effects on potential exoplanet atmospheres. The objective is to measure high resolution spectra of the diffuse X-ray background at 0.1-3 keV.

36.348 UE	BONNELL	VIPER	The VIPER mission is an observational and modeling effort to understand VLF wave penetration through and propagation above the Earth's ionosphere.
36.349 UE	LARSEN	CHI	Obtain high resolution measurements of the fluctuating plasma drifts and estimates of the associated Joule heating over a horizontal region of several hundred kilometers within the cusp region.
36.350 UG	GREEN	DEUCE	The goal of the DEUCE (Dual-channel Extreme Ultraviolet Continuum Spectrograph) mission is to measure the amount of the Lyman continuum (LyC) radiation that is being produced by the only two non-white-dwarf stars in our galaxy known to have a sufficiently low enough neutral hydrogen column density to measure their ionizing radiation directly. The results of this mission will help to answer one of the major questions of modern astrophysics concerning how and when galaxies first formed and how did their formation “feedback” into their circumgalactic environments to modify early galaxy formation during the Epoch of Re-ionization at $Z=6-11$. The science target is Alpha Centauri A+B. The LAMP mission will seek to answer how microbursts are related spatially and temporally to optical signatures of pulsating aurora.
36.351 GE	JONES	LAMP	The FORTIS mission aims to demonstrate the scientific utility and feasibility of multi-object spectroscopy over wide angular fields in the far-UV.
36.352 UG	MCCANDLISS	FORTIS	The INCAA mission will investigate the role ion-neutral coupling has on the altitude profile of energy deposition. This is accomplished by measuring in situ the ion-demagnetization altitude and the altitude-resolved Joule heating rate.
36.360 UE 41.129 UE	KAEPLER	INCAA	The purpose of the Diffuse X-Rays from the Local Galaxy (DXL-3) mission is to study the physics associated with the Solar Wind Charge Exchange (SWCX) and the Local Hot Bubble (LHB). The investigation will obtain geometric measurements of the SWCX and differentiate the foreground SWCX emission from the background LHB emissions. It will also determine the compound cross section with helium and hydrogen.
36.363 UH	GALEAZZI	DXL-3	The FURST experiment will obtain the first high resolution, high quality VUV spectrum of the Sun-as-a-star. The tREXS mission will observe diffuse X-ray sources, targeting emission from $\sim 0.2 - 0.8$ keV ($\sim 1.5 - 5$ nm) in the Cynus Loop Supernova Remnant (SNR).
36.366 US 36.367 UH	KANKELBORG MCENTAFFER	FURST tREXS	The goal of the DISSIPATION is to study the effect of Joule Heating on the high-latitude upper atmosphere. It will use a suite of complementary instruments and aims to provide the first comprehensive, concurrent, and continuous in situ measurements of neutral densities, composition, winds, and temperatures, electric fields, currents, electron densities, and precipitating energetic particles in the lower auroral ionosphere\thermosphere (100 -350 km).
36.369 GE	BENNA	DISSIPATION	The purpose of the Super Soaker missions is to study the time dependent neutral chemistry and transport of water in the upper atmosphere and to determine the resultant impact on the local temperature and Polar Mesospheric Cloud (PMC) formation.
36.376 NR	AZEEM	SUPER SOAKER	The purpose of the Mars Ascent Vehicle - Flight Test missions is to test systems for the future Mars Sample Return Missions.
36.376 UH 36.377 UH 36.378 UH 36.380 GE 36.381 GE	JACKMAN MICHELL	MAV-FT GIRAFF	GIRAFF is a combined rocket and ground-based imaging experiment to investigate the physical processes responsible for creating the Flickering and Fast Pulsating Aurora.

36.382 UE	GILCHRIST	B-SPICE	B-SPICE will use a variety of instruments to study spacecraft neutralization via ion emission while firing a high current electron beam.
36.386 UE 36.387 UE 36.388 UE 36.392 UE 36.393 UE 36.394 IIF 36.390 GE	BARJATYA SAMARA	APEP BADASS	These experiments will use a variety of science instruments to study upper atmospheric conditions before, during and after a solar eclipse. The primary objective of the Black and Diffuse Aurora Science Surveyor (BADASS) experiment is to explore the processes responsible for creating the optical variations observable withing the diffuse aurora with the specific target of the black aurora.
36.395 UH	MARSHALL	REDSoX	The primary objective of Rocket Experiment Demonstration of a Soft X-ray Polarimeter (REDSoX) is to make the first measurement of the linear X-ray polarization in the soft X-ray band ($E < 1$ keV). The first flight of the REDSoX Polarimeter would target Mk 421, which is commonly modeled as a highly relativistic jet aimed nearly along the line of sight. An isolated neutron star (INS) with a strong magnetic field would be the target for a future flight.
36.397 UE 36.398 UE	LYNCH	GNEISS	The Geophysical Non-Equilibrium Ionospheric System Science Rocket (GNEISS) mission objective is to gather a fully instrumented, multipoint, multipatform dataset enabling a case study of the 3D Ionospheric volume surrounding a non-sheetlike discrete auroral structure.
36.400 UE 36.401 UE	KUDEKI	EVEEX-2	The primary science objective of the EVEEX-2 experiment is to study the initiation physics and growth of post-sunset ionospheric plasma depletions from Roi-Namur. The mission will employ a pair of “high-flyer” sounding rockets consisting of a main and sub-payload --- both targeting an apogee of 375 km --- launched successively, about forty five minutes apart.
36.402 UH	GALEAZZI	LXT	The goal of the proposed Lobster-Eye X-Ray Telescope (LXT) investigation is to use the knowledge we acquired on micropore optics to build an instrument that couples them with CCD detectors. The investigation will bring the technology readiness level of this new instrument design from TRL 4 to TRL 7. The mission will observe the Cygnus Loop with a single pointing using micropore optics coupled to large area CCD detectors to test the technology for future applications.
36.406 US	WOODS	EVE	The primary objective for this mission is to provide an underflight calibration for the EUV Variability Experiment (EVE) aboard the NASA Solar Dynamics Observatory (SDO) satellite. The EVE program provides solar EUV irradiance data for NASA’s Living With the Star (LWS) program, including near real-time data products for use in operational atmospheric models that specify the space environment and to assist in forecasting space weather operations.
41.132 UO	KOEHLER	ROCKON - RockSAT-C	The primary objective of the RockOn/RockSat mission is to provide university undergraduate level students and instructors with a space flight opportunity that involves minimal cost, minimal time investment, minimal complexity, and minimal impact on the NASA Sounding Rocket Program. The mission is intended to be an introductory flight opportunity to provide exposure to, and spark interest in, space-based science missions.

41.132 WO 46.133 WO	KOEHLER	ROCKON - RockSAT-C	The primary objective of the RockOn/RockSat mission is to provide university undergraduate level students and instructors with a space flight opportunity that involves minimal cost, minimal time investment, minimal complexity, and minimal impact on the NASA Sounding Rocket Program. The mission is intended to be an introductory flight. The purpose of the 46.015 mission is to provide risk mitigation for rocket propelled ejectable chemical ampoule systems that will be employed on future science missions. The mission goals are to demonstrate repeatable success of the ignition trains of both the ampoule rocket motors and the ampule deflagration.
46.015 GT	HALL		
36.361 UE 36.362 UE 41.127 UE 41.128 UE 46.016 CE	LEHMACHER AZEEM	VORTEX SUPER SOAKER	The science goal of VortEX is to better understand nonlinear gravity wave (GW) interactions in the upper mesosphere and lower thermosphere (MLT), and the formation of vortices and stratified turbulence (ST). The purpose of the Super Soaker missions is to study the time dependent neutral chemistry and transport of water in the upper atmosphere and to determine the resultant impact on the local temperature and Polar Mesospheric Cloud (PMC) formation.
46.017 UO 46.042 WO	KOEHLER	RockSat-X	The primary objective of the RockSat-X mission is to provide university undergraduate level students and instructors with a space flight opportunity that involves the use of a standard carrier payload with predefined mechanical, telemetry, power and attitude control capabilities and parameters that participating schools can adapt to in order to meet their individual experiment objectives. The mission is intended to provide expanded opportunities to RockOn participants and other interested schools with experiment bays exposed to the space environment.
46.018 UP	KOEHLER	RockSat-XN	The purpose of the RockSat-XN mission is to provide university undergraduate level students and instructors (both domestic and foreign) a space flight opportunity that involves minimal cost, time investment, complexity and impact to the NASA Sounding Rocket Program. This exposure to space based scientific investigations will encourage participants to seek career paths that result in future involvement in space-based scientific research.
46.019 UO	VIERIA	USIP	The purpose of the University Student Instrument Program (USIP) is to encourage participants to seek future involvement in space-based science missions by providing university undergraduate level students and faculty with a space flight opportunity that will allow their custom built experiments to be exposed to the space environment.
46.025 UE 46.026 UE	BARJATYA	SEED	The goal of the SEED missions is to collect the first simultaneous multipoint spatial and temporal observations of low-latitude Sporadic-E layers and their associated electrodynamics and neutral dynamics.
46.030 UO	KOEHLER	RockSat-XN	The purpose of the RockSat-XN mission is to provide university undergraduate level students and instructors (both domestic and foreign) a space flight opportunity that involves minimal cost, time investment, complexity and impact to the NASA Sounding Rocket Program. This exposure to space based scientific investigations will encourage participants to seek career paths that result in future involvement in space-based scientific research.
46.039 IE	MILOCH	ICI-5b	The ICI-5b mission seeks to understand the physical drivers of plasma turbulence, determine the size of the eddy structures, and explore how these plasma structures disturb radio signals.

49.004 UE	CONDE	C-REX-2	The purpose of the Cusp-Region Experiment Version 2.0 (C-REX-2) mission is to identify mechanisms responsible for creating a region of enhanced neutral mass density at 400 km altitude that appears to be a permanent feature of Earth's cusp-region thermosphere. The foundation of the investigation will be to obtain absolute neutral wind measurements by following the drift of 20 neutral strontium clouds released from the rocket at altitudes between 200 and 400 km. Drift tracking will be done by photographic triangulation, using cameras located on Svalbard and aboard a NASA aircraft flying along the east coast of Greenland.
51.001 UE	LARSEN	AZURE	The purpose of the Auroral Zone Upwelling Release Experiment (AZURE) missions is to determine the relative contribution of the barometric (compression and expansion) and dynamic (divergence and convergence) vertical velocity components in the lower E region across the altitude range of maximum Joule heating.
51.002 UE	LARSEN	AZURE	The purpose of the Auroral Zone Upwelling Release Experiment (AZURE) missions is to determine the relative contribution of the barometric (compression and expansion) and dynamic (divergence and convergence) vertical velocity components in the lower E region across the altitude range of maximum Joule heating.
52.003 UE	KLETZING	TRICE-2	The purpose of the Twin Rockets to Investigate Cusp Electrodynamics II (TRICE-2) missions is to measure cusp signatures of reconnection occurring at the magnetopause during steady IMF Bz southward conditions. This will be accomplished by launching two nearly identical instrumented payloads, flying at low and high altitudes, with a variety of separations in time and space.
52.004 UE	KLETZING	TRICE-2	The purpose of the Twin Rockets to Investigate Cusp Electrodynamics II (TRICE-2) missions is to measure cusp signatures of reconnection occurring at the magnetopause during steady IMF Bz southward conditions. This will be accomplished by launching two nearly identical instrumented payloads, flying at low and high altitudes, with a variety of separations in time and space.
52.005 UE	LABELLE	CAPER-2	The Cusp Alfvén and Plasma Electrodynamics Rocket (CAPER) is designed to investigate the interactions between electrical waves and charged particles in a region of space known as the "polar cusp." The dayside high-latitude polar cusp is a unique environment where direct access of solar wind particles to low altitudes leads to similar particle precipitation and acceleration processes as on the nightside, but dominated by a rather different set of magnetospheric
52.007 UE	DELAMERE	KINET-X	KiNET-X studies how momentum transport is affected by kinetic-scale physics, i.e. formation of parallel electric fields and dissipation, how electromagnetic energy is converted into plasma kinetic and thermal energy, and what the interplay is between fluid- and kinetic-scale processes.
52.009 UE	REEVES	Beam-PIE	The Beam-PIE mission will use an electron beam to produce VLF radiowaves. The radio waves are to be detected with an antenna on a separate receiver payload section. Additionally, ambient plasma conditions, and the possible effects of the radio waves on the local plasma environment, will be measured. Optical and radar measurements will be used to detect effects of the waves on the atmosphere.
